## Outline

PS 6

Practice Questions

### Question 1.a

We have n i.i.d. draws from uniform distribution on  $[0, \theta]$ , the pdf is:

$$f(x) = \begin{cases} \frac{1}{\theta} & x \in [0, \theta] \\ 0 & \text{Otherwise} \end{cases}$$

The likelihood function is written as:

$$\hat{L}(\theta; \mathbf{X}) = \frac{1}{\theta^n} \prod_{i=1}^n \mathbf{1}(0 \le X_i \le \theta)$$

Denote  $X_m = max(X_1, X_2, ..., X_n)$ , then we discuss the relationship between  $X_m$  and  $\theta$ .

- If  $\theta < X_m$ , then  $\mathbf{1}(0 \le x_m \le \theta) = 0$ , which means  $\hat{L}(\theta; \mathbf{X}) = 0$ .
- If  $\theta \geq X_m$ , then  $\hat{L}(\theta; \mathbf{X}) = \frac{1}{\theta^n}$ . Clearly, when  $\theta$  increases,  $\frac{1}{\theta^n}$  decreases.

Therefore, we know the maximum of  $\hat{L}(\theta; \mathbf{X})$  is achieved when  $\theta = X_m$ . In other words, we constructed:

$$\hat{\theta} = X_m$$

# Question 1.b

•  $\hat{\theta} = X_m = \max\{X_1, X_2, ..., \}$ , the pdf of each  $X_i$  in part 1.(a) and the cdf is:

$$F(x) = \begin{cases} 0 & \text{If } x \in (-\infty, 0) \\ \frac{x}{\theta} & \text{If } x \in [0, \theta] \\ 1 & \text{If } x \in (\theta, \infty) \end{cases}$$

ullet We can easily construct the CDF and pdf of  $\hat{ heta}=X_m$ :

$$cdf: F_{\hat{\theta}}(x) = \begin{cases} 0 & \text{If } x \in (-\infty, 0) \\ (\frac{x}{\theta})^n & \text{If } x \in [0, \theta] \\ 1 & \text{If } x \in (\theta, \infty) \end{cases} \qquad pdf: f_{\hat{\theta}}(x) = \begin{cases} \frac{n}{\theta} (\frac{x}{\theta})^{n-1} & \text{If } x \in [0, \theta] \\ 0 & \text{Otherwise} \end{cases}$$

- $E(\hat{\theta}_{MLE}) = \int_0^\theta x f_{\hat{\theta}}(x) dx = \int_0^\theta n(\frac{x}{\theta})^n dx = \frac{n}{\theta^n} \frac{x^{n+1}}{n+1} \Big|_0^\theta = \frac{n\theta}{n+1}.$
- Then we know  $E(\hat{\theta}_{MLE}) \theta = -\frac{\theta}{n+1}$

◆ロト ◆部ト ◆差ト ◆差ト 差 めなべ

## Question 1.c

1 Variance We know:

$$E[\hat{\theta}_{MLE}^{2}] = \int_{0}^{\theta} x^{2} f_{\hat{\theta}}(x) dx = \int_{0}^{\theta} \frac{n}{\theta^{n}} x^{n+1} dx = \frac{n}{\theta^{n}} \frac{x^{n+2}}{n+2} |_{0}^{\theta} = \frac{n\theta^{2}}{n+2}$$

Therefore, we know the variance of our estimator is:

$$Var[\hat{\theta}_{MLE}] = E[\hat{\theta}_{MLE}^2] - E[\hat{\theta}_{MLE}]^2 = \frac{n\theta^2}{n+2} - (\frac{n\theta}{n+1})^2 = \frac{\theta^2}{(n+1)^2(1+\frac{2}{n})^2}$$

2 Rate of convergence

 $r_n$  quantifies how fast the estimation error decreases when increasing the sample size n. In other words, what we are interested in is when divided by  $n^{-r}$  or multiplied by  $n^r$ , what's the largest r such that  $|\hat{\theta}_n - \theta|$  remains stochastic bounded.  $r_n = (n^r)$  is rate of convergence. Clearly, for  $Sd[\hat{\theta}] = \frac{\theta}{(n+1)\sqrt{(1+\frac{2}{n})}}$ , the convergence rate should be n.

5 / 14

# Question 1.c

- 3 Consistency of  $\hat{\theta}$ . We already know  $E(\hat{\theta}_{MLE}) = \frac{n\theta}{n+1} = \frac{\theta}{1+\frac{1}{n}} \cdot \lim_{n \to \infty} E(\hat{\theta}_{MLE}) = \theta$ . So it is an unbiased estimator.
- We also know:

$$\lim_{n\to\infty} Var(\hat{\theta}_{MLE}) = \lim_{n\to\infty} \frac{\theta^2}{n^2 + 4n + 5 + \frac{2}{n}} = 0$$

• Since our estimator is unbiased, using Chebyshev's inequality we know  $P(|\hat{\theta} - \theta| > \epsilon) \leq Var(\hat{\theta})/\epsilon^2$ . Then for any  $\epsilon > 0$ , if  $\lim_{n \to \infty} Var(\hat{\theta}) = 0$  we have  $\lim_{n \to \infty} P(|\hat{\theta} - \theta| > \epsilon) = 0$  as well, which means consistency is proved.  $(\hat{\theta} \xrightarrow{p} \theta)$ .

### Question 1.d

• For asymptotic distribution of our estimator.

$$\hat{ heta}_{MLE} = \max(X_1,...,X_n) = X_m$$
 and  $r_n = n$ 

Notice that:

$$Pr(n(X_m - \theta) < x) = Pr(X_m < \frac{x}{n} + \theta)$$

Then we can derive that:

$$Pr(X_m < \frac{x}{n} + \theta) = (1 + \frac{x}{n\theta})^n$$

• Since  $e^x = \lim_{n \to \infty} (1 + \frac{x}{n})^n$ , we know the limit of probability:

$$\lim_{n\to\infty} (1+\frac{x}{n\theta})^n = e^{\frac{x}{\theta}} \quad (x\leq 0)$$

• The cdf of asymptotic distribution of our estimator is

$$F(x) = \begin{cases} e^{\frac{x}{\theta}} & x \le 0\\ 1 & x > 0 \end{cases}$$

• which tells us the asymptotic distribution is exponential, but on the negative side of the real line.

# Core July 2022 Q2

Suppose  $X_1$ ,  $X_2$ , ...,  $X_n$  are iid realizations from Uniform distribution with support  $[0, \theta]$ , where  $\theta$  is an unknown parameter.

- a Show that  $\hat{\theta}_n = 2 imes rac{\sum\limits_{i=1}^n X_i}{n}$  is an unbiased and consistent estimator of  $\theta$ .
- b Is  $\hat{\theta}_n = 2 \times X_1$  an unbiased and consistent estimator of  $\theta$ ? Why? Show your work.
- c Show that  $\hat{\theta}_n = \max\{X_1, ..., X_n\}$  is a biased estimator of  $\theta$ .

# Core July 2022 Q2.a

Suppose  $X_1$ ,  $X_2$ , ...,  $X_n$  are iid realizations from Uniform distribution with support  $(0, \theta)$ , where  $\theta$  is an unknown parameter.

- a Show that  $\hat{\theta}_n = 2 imes rac{\ddot{\sum}_{i=1}^n X_i}{n}$  is an unbiased and consistent estimator of  $\theta$ .
  - Unbiased:  $E[\hat{\theta}_n] = \frac{2}{n} \sum_{i=1}^n E[X_i] = \frac{2}{n} * n * \frac{\theta}{2} = \theta$ .  $E[\hat{\theta}_n] = \theta$ , so unbiased.
  - Consistent: By Law of Large Numbers,  $\bar{X}_n = \frac{\sum\limits_{i=1}^n X_i}{n} \xrightarrow{p} E[X] = \frac{\theta}{2}$ , hence  $2\bar{X}_n \xrightarrow{p} \theta$ , so consistent.

## Core July 2022 Q2.b

Suppose  $X_1$ ,  $X_2$ , ...,  $X_n$  are iid realizations from Uniform distribution with support  $(0, \theta)$ , where  $\theta$  is an unknown parameter.

- b Is  $\hat{\theta}_n = 2 \times X_1$  an unbiased and consistent estimator of  $\theta$ ? Why? Show your work.
  - Unbiased:  $E[\hat{\theta}_n] = 2E[X_1] = 2 * \frac{\theta}{2} = \theta$ , so unbiased.
  - Not Consistent:

$$P(|2X_1 - \theta| > \epsilon) = P(|X_1 - \frac{\theta}{2}| > \frac{\epsilon}{2}) = P(X_1 > \frac{\theta + \epsilon}{2}) + P(X_1 < \frac{\theta}{2} - \frac{\epsilon}{2})$$

Suppose  $\epsilon$  is small and  $\theta > \epsilon$ , then we have

$$\begin{cases} P(X_1 > \frac{\theta + \epsilon}{2}) = 1 - \frac{\theta + \epsilon}{2\theta} \\ P(X_1 < \frac{\theta}{2} - \frac{\epsilon}{2}) = \frac{\theta - \epsilon}{2\theta} \end{cases}$$

 $P(|2X_1 - \theta| > \epsilon) = 1 - \frac{\epsilon}{\theta} \neq 0$ , so not consistent.

# Core July 2022 Q2.c

Suppose  $X_1$ ,  $X_2$ , ...,  $X_n$  are iid realizations from Uniform distribution with support  $(0, \theta)$ , where  $\theta$  is an unknown parameter.

- c Show that  $\hat{\theta}_n = \max\{X_1, ..., X_n\}$  is a biased estimator of  $\theta$ . We want to know  $E[\hat{\theta}_n]$ . To get this, we need to first derive the CDF and PDF of  $\hat{\theta}_n = X_m = \max\{X_1, ..., X_n\}$ .
- Clearly as you just derived in your problem set 6,

$$cdf: F_{\hat{\theta}_n}(x) = \begin{cases} 0 & \text{if } x \in (-\infty, 0) \\ (\frac{x}{\theta})^n & \text{if } x \in [0, \theta] \\ 1 & \text{if } x \in (\theta, \infty) \end{cases} \quad pdf: f_{\hat{\theta}_n}(x) = \begin{cases} \frac{n}{\theta} (\frac{x}{\theta})^{n-1} & \text{if } x \in [0, \theta] \\ 0 & \text{Otherwise} \end{cases}$$

Then 
$$E(\hat{\theta}_n) = \int_0^{\theta} x f_{\hat{\theta}_n}(x) dx = \int_0^{\theta} n(\frac{x}{\theta})^n dx = \frac{n}{\theta^n} \frac{x^{n+1}}{n+1} \Big|_0^{\theta} = \frac{n\theta}{n+1}$$
.  
Then we know  $E[\hat{\theta}_n] \neq \theta$ . We proved this is a biased estimator.

\* Although he didn't ask, but you just proved in PS6 1.c that  $\hat{\theta}_n = X_m$  is a consistent estimator

## Core Jun 2017 Q1

Suppose  $X \sim N[e^{\alpha\beta},1]$  and  $Y \sim N[e^{\alpha},1]$ , independent of each other. Let  $\{X_i,Y_i\}$ , i=1,2...,n be i.i.d. observations on (X,Y), and define  $\bar{X}=n^{-1}\sum_{i=1}^n X_i$  and  $\bar{Y}=n^{-1}\sum_{i=1}^n Y_i$ . We are to estimate  $\beta$  by  $\hat{\beta}=\frac{\log \bar{X}}{\log \bar{Y}}$ .

Prove the consistency of  $\hat{\beta}$  (namely,  $\hat{\beta} \xrightarrow{p} \beta$ ) and derive its asymptotic distribution.

### Core Jun 2017 Q1

We know  $X \sim N[e^{\alpha\beta}, 1]$ ,  $Y \sim N[e^{\alpha}, 1]$ 

By LLN:

$$\begin{cases} \bar{X} \xrightarrow{p} E[X] = e^{\alpha \beta} \\ \bar{Y} \xrightarrow{p} E[Y] = e^{\alpha} \end{cases}$$

By CMP:

$$\begin{cases} \log \bar{X} \xrightarrow{p} \log e^{\alpha\beta} = \alpha\beta \\ \log \bar{Y} \xrightarrow{p} \log e^{\alpha} = \alpha \end{cases}$$

By property of convergence

$$\begin{cases} \log \bar{X} \xrightarrow{d} \alpha \beta \\ \log \bar{Y} \xrightarrow{d} \beta \end{cases}$$

By Slutsky

$$\hat{\beta} = \frac{\log \bar{X}}{\log \bar{Y}} \xrightarrow{d} \frac{\alpha \beta}{\alpha} = \beta, \Rightarrow \hat{\beta} \xrightarrow{p} \beta$$

So we proved consistency of  $\hat{\beta}:\hat{\beta}\xrightarrow{p}\beta$ 

▶ ◀♬ ▶ ◀ 볼 ▶ ○ 볼 · ~ ? Q C

#### Core Jun 2017 Q1

We know  $\hat{\beta} = \frac{log(X)}{log(\bar{Y})} = f(\bar{X}, \bar{Y})$ , a function of  $(\bar{X}, \bar{Y})$ .

By CLT:

$$\begin{cases} \sqrt{n}(\bar{X} - e^{\alpha\beta}) \xrightarrow{d} N(0, 1) \\ \sqrt{n}(\bar{Y} - e^{\alpha}) \xrightarrow{d} N(0, 1) \end{cases}$$

By independence of X and Y:

$$\sqrt{n}(\begin{bmatrix} \bar{X} \\ \bar{Y} \end{bmatrix} - \begin{bmatrix} e^{\alpha\beta} \\ e^{\beta} \end{bmatrix}) \xrightarrow{d} N(0, \Sigma), \Sigma = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

ullet By multivariate delta method, considering  $\hat{eta} = rac{\log(X)}{\log(ar{Y})} = h(ar{X}, ar{Y})$ 

$$\begin{split} & \sqrt{n}(\hat{\beta} - \beta) \xrightarrow{d} \textit{N}(0, \nabla h(\beta)' \Sigma \nabla h(\beta)) \\ \nabla h(\beta)'|_{\mu_{X}, \mu_{Y}} &= \begin{bmatrix} \frac{\partial h(\beta)}{\partial X} \\ \frac{\partial h(\beta)}{\partial Y} \end{bmatrix} = \begin{bmatrix} \frac{1}{\overline{X} \log(\overline{Y})} \\ -\frac{\log(X)}{(\log(\overline{Y}))^{2} \overline{Y}} \end{bmatrix}_{\mu_{X}, \mu_{Y}} = \begin{bmatrix} \frac{1}{e^{\alpha \beta} \alpha} \\ -\frac{\beta}{\alpha e^{\alpha}} \end{bmatrix} \end{split}$$

Therefore, the asymptotic distribution is:

$$\sqrt{n}(\hat{\beta} - \beta) \xrightarrow{d} N(0, \frac{1}{\alpha^2 e^{2\alpha\beta}} + \frac{\beta^2}{\alpha^2 e^{2\alpha}})$$
